Memo from: Upper Management
To: Product Development Team
Subject: Coding Project Release I
Date: 10 September 2013

As per earlier discussions, please complete the following tasks regarding your coding implementation project:

- By Friday 13 September please prepare a one to two page scenario describing how a user will be able to use your product prototype at the first demonstration to be conducted on Friday the 11th of October. Include as much detail as you can regarding the specific commands that the user will be able to execute, and the actions that the system is expected to make in response. You may want to look at the samples on the CS 440 web site, (under Project), for ideas, but be aware that your scenario should be better than the sample given.   (You will need your group number, project name, and group members names at a minimum, as well as possibly an introductory paragraph or two describing the project.) Please upload your document to both the Blackboard system and the git repository assigned to this project by 5:00 P.M.

- Please prepare an iceScrum project for the first release, to be ready by 8:00 A.M. on Monday 16 September, i.e. in time to start the first sprint. You should set up the dates for the Releases and sprints as described earlier, add as many stories as you can to the sandbox, migrate some stories to the product backlog for the first release, generate some tasks, and assign at least one task to each group member.
